

How can we save drinking water?

We're often unaware of how much drinking water we really use and literally waste? In one minute only, 13 litres of drinking water goes down the drain while we're brushing our teeth or rubbing our hands with the tap water running. The toilet tank that isn't properly sealed, can 'use' more than 200 litres of water daily.

WAYS TO SAVE WATER:

- Turn the tap off while brushing teeth, shampooing your hair or rubbing soap on your hands.
- Bathing consumes more water than showering, therefore take a shower more often than a bath.
- Turn off the taps completely.
- New models of toilet tanks offer the START and FINISH buttons, so you can stop the flushing when you decide. Make sure the tank doesn't leak.

Contribute to a responsible attitude to our environment. While reducing the consumption of drinking water we indirectly also reduce the consumption of electricity, contribute to the preservation of the environment and alleviate the climate change effects.
